

melita

micro-breweries
to produce *nutrient*
rich fertilizer
out of food waste

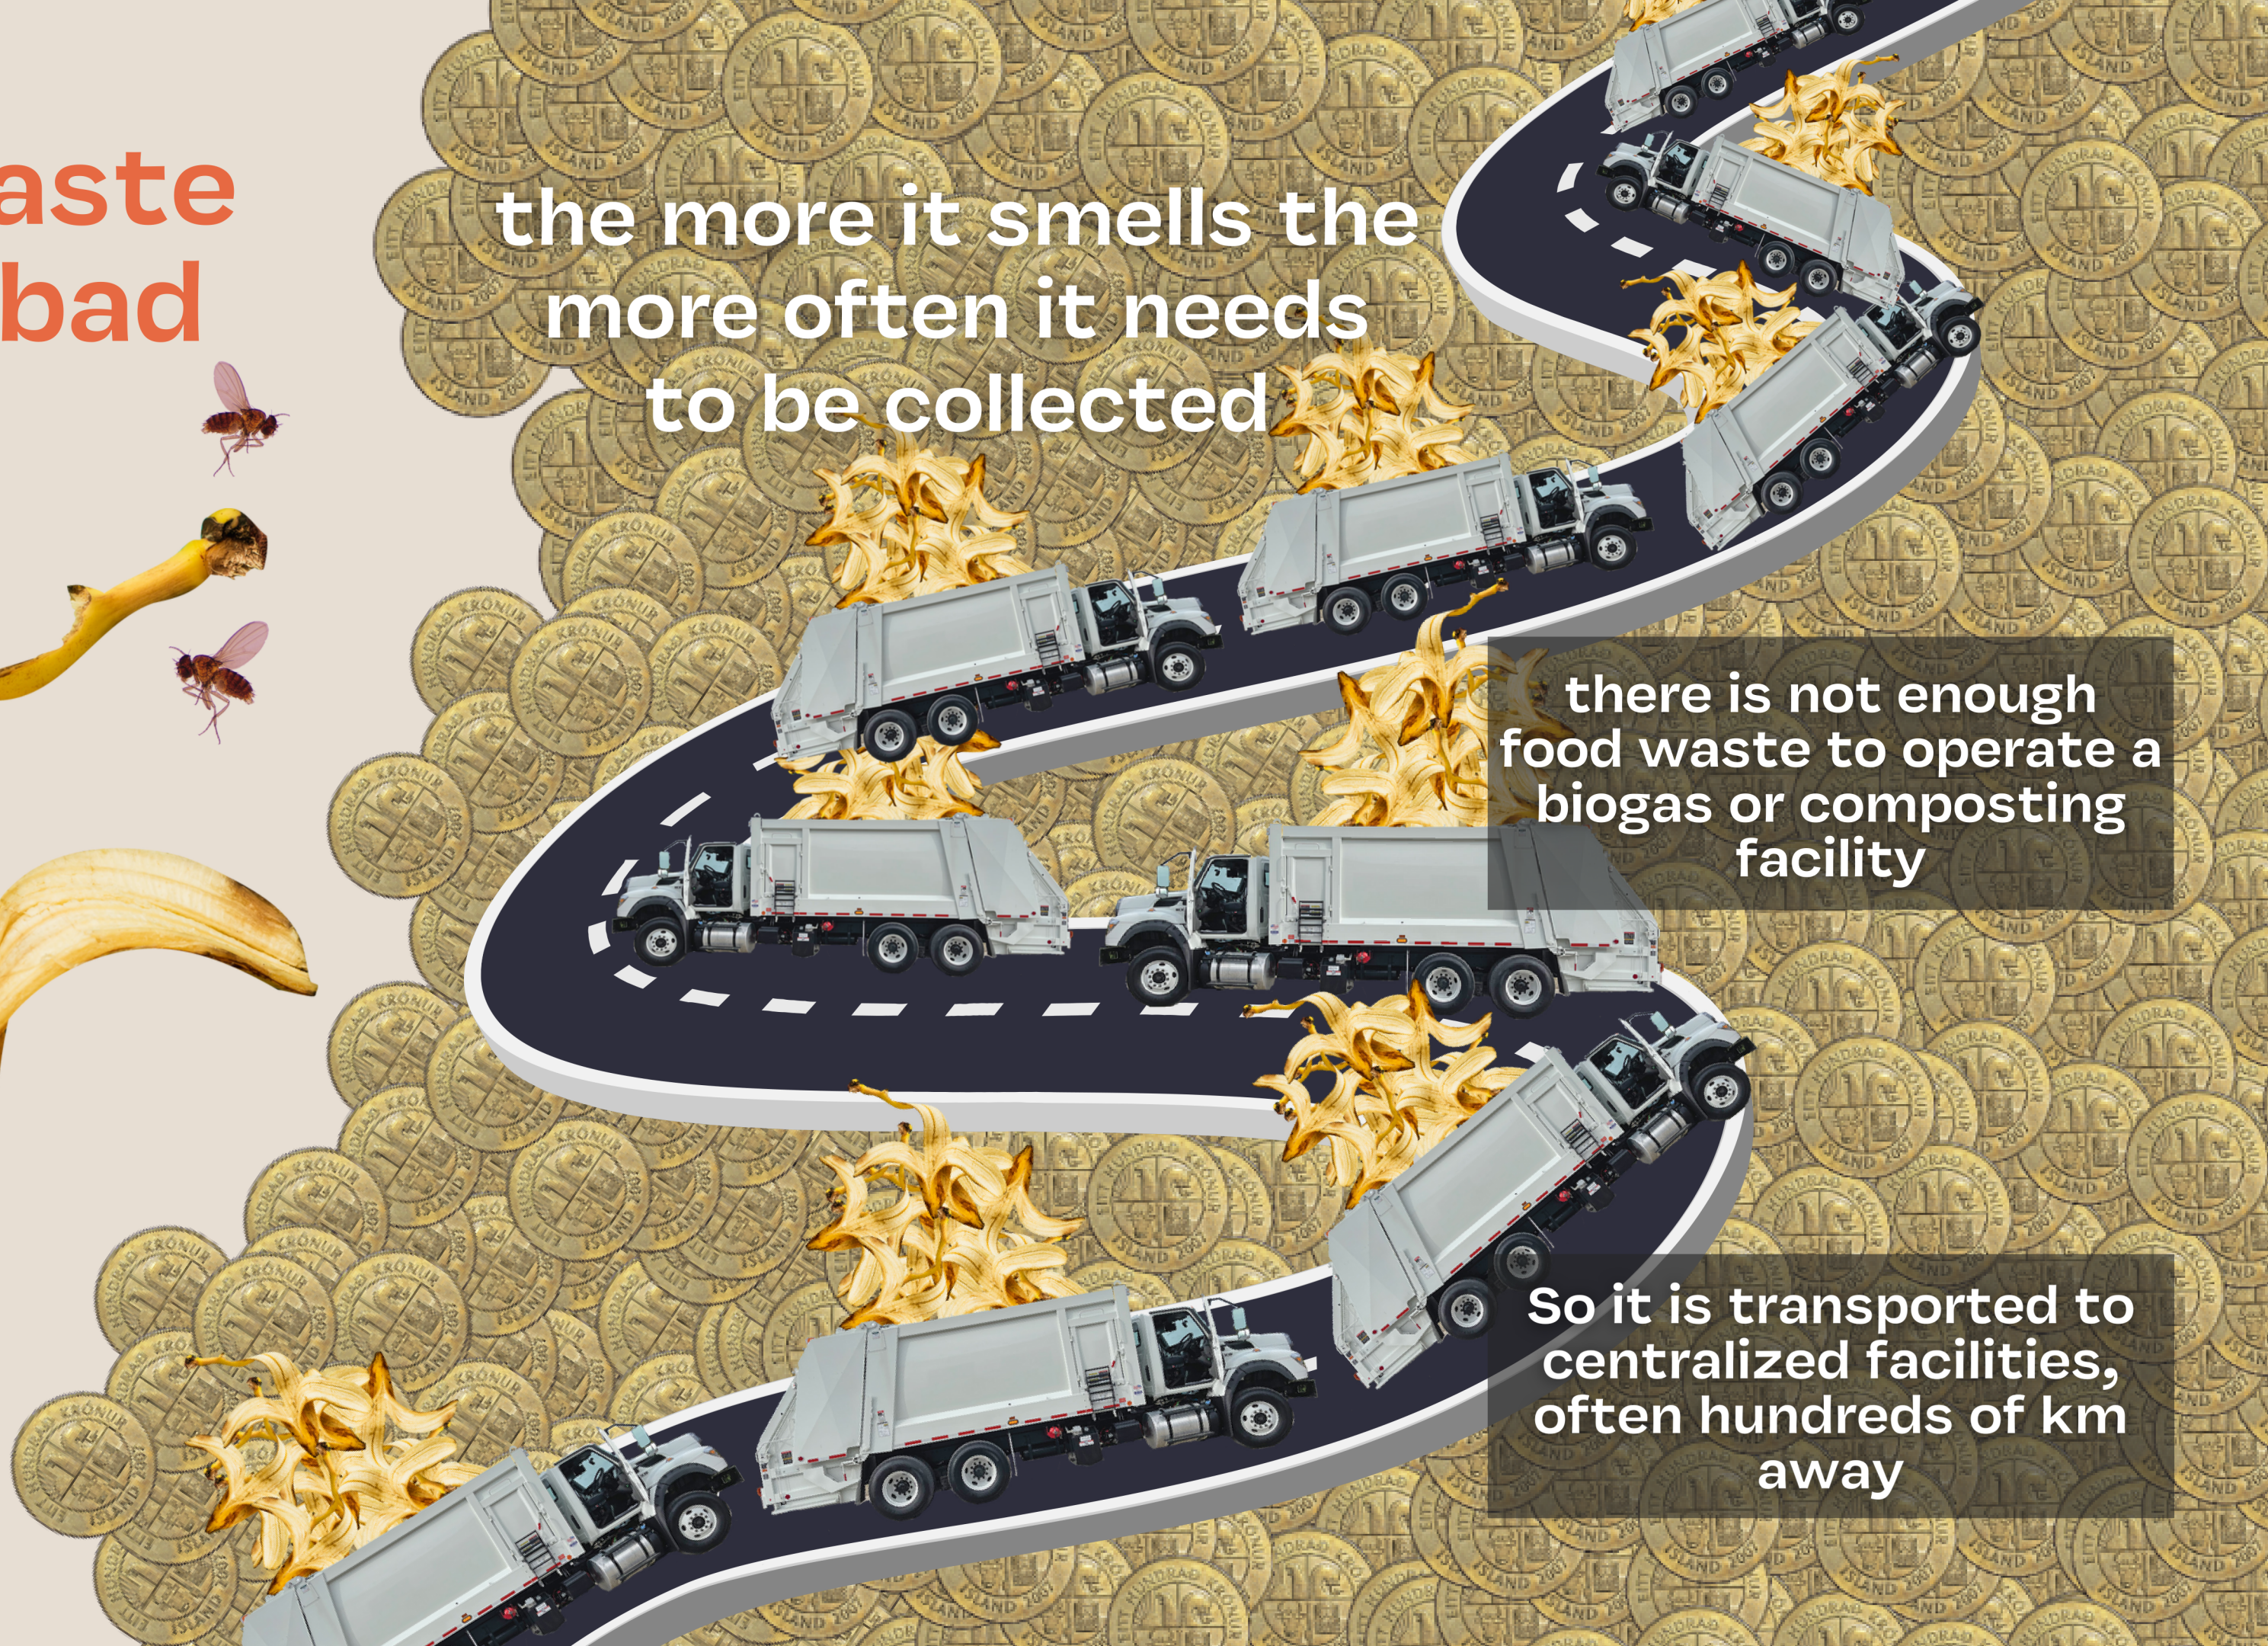

**Food waste
smells bad**

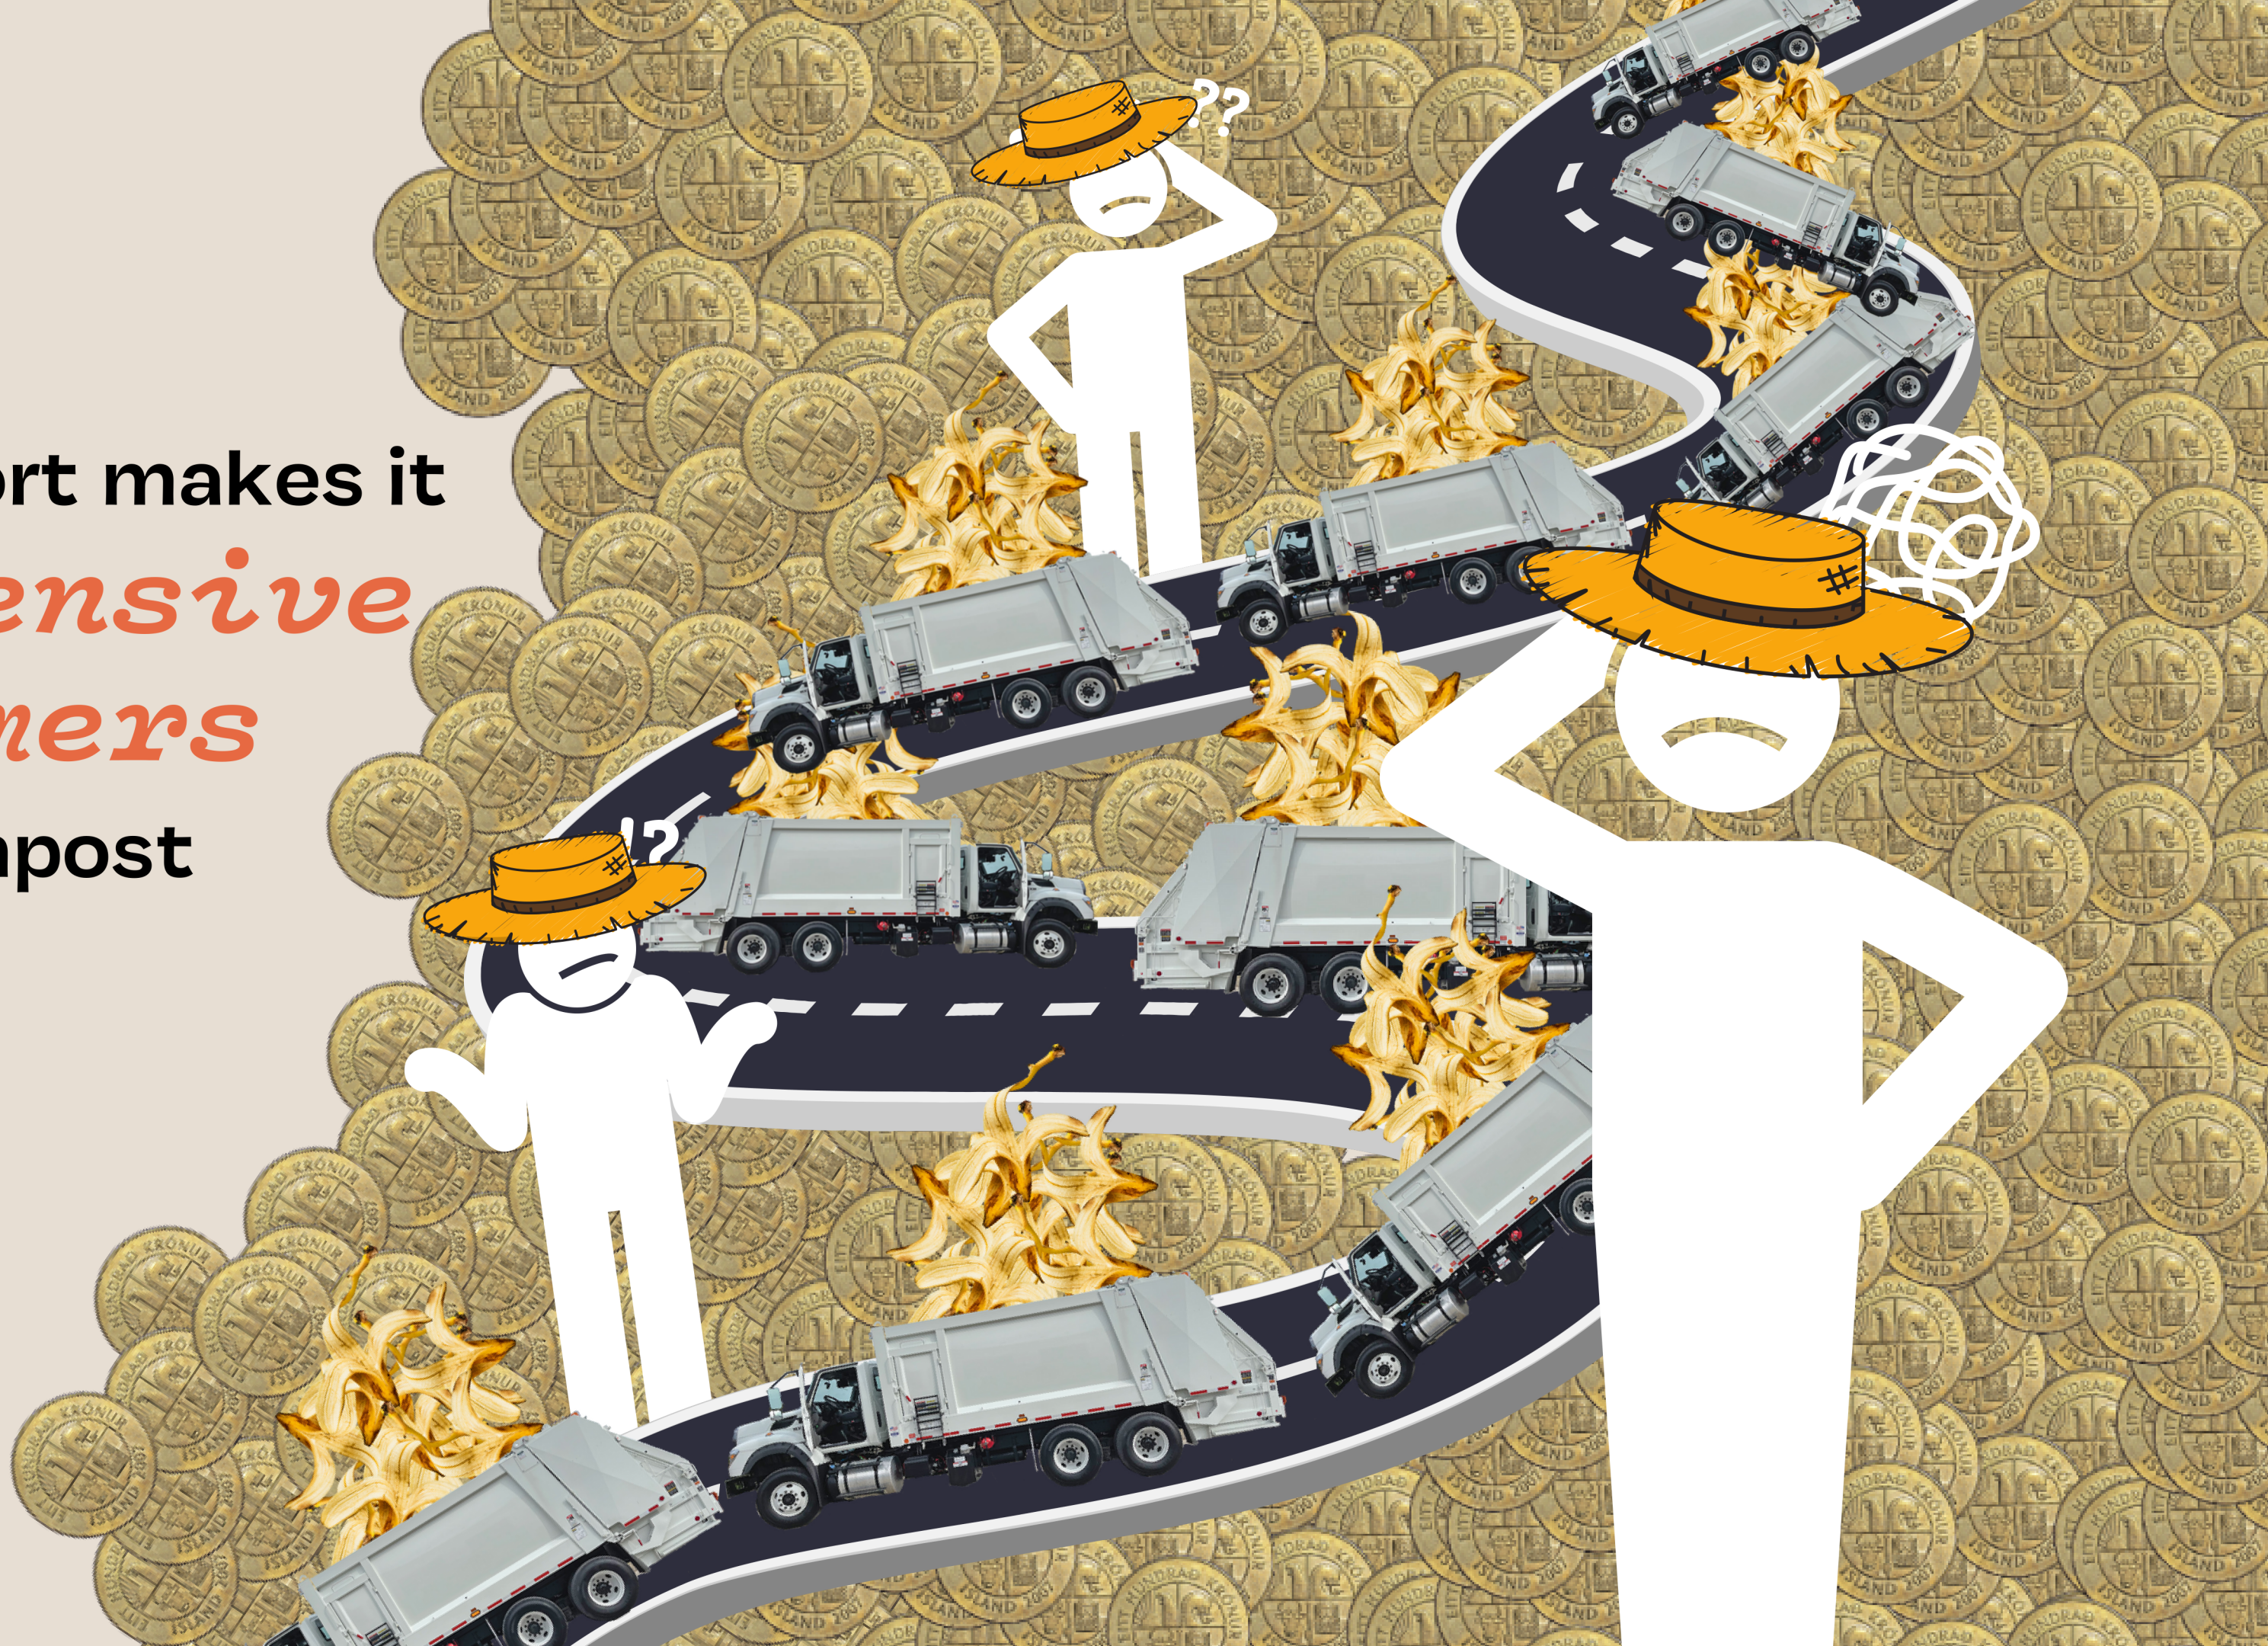

**the more it smells the
more often it needs
to be collected**

**there is not enough
food waste to operate a
biogas or composting
facility**

**So it is transported to
centralized facilities,
often hundreds of km
away**

all this transport makes it
too expensive
for farmers
to use the compost
that is created

Our micro-breweries are *easily scalable* to suit the size of any municipality

Allowing us to produce fertilizer *locally* and in close proximity *to farmers*

*smell-free,
simple &
convenient*

70% less

we are also a *carbon*
sequestration solution

Target market
municipalities that are rural,
low density or have less than
25.000 residents

80%
of municipalities in
the Nordic Countries

It's only waste
if it's
wasted
